More hospitals are making use of virtual reality games to complement conventional therapy for patients. The use of virtual reality games can help to motivate patients and make therapy more enjoyable. Patients can be engaged in games that simulate real-life situations, which can help to improve their physical and cognitive abilities. For example, patients can practice picking up objects in a virtual supermarket, which can help to improve their fine motor skills. Virtual reality games can also be used to provide immediate feedback on a patient's progress, which can help to motivate patients to continue with their therapy.

There are also benefits to using virtual reality games in rehabilitation. These games can be used to provide a fun and interactive way to help patients learn new skills. Patients can be engaged in games that simulate real-life situations, which can help to improve their physical and cognitive abilities.
