Evaluation of Mepilex® Ag, a silver impregnated soft silicone absorbent dressing in patients with critically colonized venous leg ulcers – 5 case reviews

Diane Eng Li Kheng, Nurse Clinician of Wound & Stoma Care, Tan Tock Seng Hospital, Singapore

Background
- Studies have shown that 1% of the world-wide population will have a leg ulcer, and the incidences will increase with increasing age. (Jonas 2000)
- In the United States, 80% of lower extremity ulcers are venous, with the remaining percentage having neuro ischemic or, of mixed etiology origin. (Valencia et al 2001)
- All chronic wounds are believed to contain some level of bacteria bioburden. Depending on the number of organisms, the level of bacteria may be classified as contamination, colonization, critically colonized and infection. (Kingsley 2003)
- Once the wound becomes critically colonized (a level which affects skin cell proliferation and tissue repair), it may delay healing and may eventually progress to a classic infection, which includes erythema, cellulitis, fever, proliferation and tissue repair), it may delay healing and may eventually progress to a classic infection, which includes erythema, cellulitis, fever, proliferation and tissue repair), it may delay healing and may eventually progress to a classic infection, which includes erythema, cellulitis, fever, proliferation and tissue repair, spontaneous pain, erythema, oedema and peri wound skin maceration disappeared at 2nd week in 80% of the cases. (Mulder et al 2007)
- Silver has been used as an antimicrobial agent for thousands of years. (Burrell 2003)
- The activity of silver lies in its ionic form and has the ability to bind at increased white blood cell count, odor, pain and exudate. (DeVington 2003)
- To address bacterial imbalance, clinicians may attempt a combination of treatment modalities. In conjunction with systemic antibiotic, there is a number of antimicrobial dressing indicated for the use on infected wounds. The major benefits of these dressings are that they reduce the presence of pathogens and decrease the risk of infection while creating an environment that readily supports the normal sequence of wound healing. (Valencia et al 2001)
- Mepilex® Ag, a silver impregnated soft silicone absorbent dressing, is a new dressing change. (Valencia et al 2001)
- The activity of silver lies in its ionic form and has the ability to bind at increased white blood cell count, odor, pain and exudate. (DeVington 2003)
- The case reviews suggest that Mepilex® Ag, the silver impregnated soft silicone absorbent dressing had a favourable influence on wound prognosis and was well tolerated and accepted in the treatment of venous leg ulcer with clinical signs of critical colonisation. The dressing performed well in terms of patient comfort and ease of use, while the incidence and severity of maceration and erythema decreased during the review period. (Mulder et al 2007)

Aim of Study
- The case reviews evaluate the clinical efficacy and safety of Mepilex® Ag, a silver impregnated soft silicone absorbent dressing in the management of venous leg ulcers with clinical signs of critical colonisation. (Parsons et al 2005)
- A convenient sample was used. (Kingsley 2003)
- 5 patients with non healing venous leg ulcers referred to the wound clinic during 1st August to 31st August 2007, were recruited. (Mölnlycke Health Care)
- Ulcer areas and healing were assessed weekly for 4 weeks. Assessment includes clinical signs of critical colonisation (spontaneous pain between dressing changes, erythema, oedema, malodour and hawry exudate), wound area tracing and photography. In addition, per ulcer skin maceration, absorption capacity and leakage were evaluated at every dressing change. (Jones 2000)

Methodology
- The major benefits of these dressings are that they reduce the presence of pathogens and decrease the risk of infection while creating an environment that readily supports the normal sequence of wound healing. (Valencia et al 2001)
- Silver has been used as an antimicrobial agent for thousands of years. (Burrell 2003)
- The activity of silver lies in its ionic form and has the ability to bind at increased white blood cell count, odor, pain and exudate. (DeVington 2003)

The major benefits of these dressings are that they reduce the presence of pathogens and decrease the risk of infection while creating an environment that readily supports the normal sequence of wound healing. (Valencia et al 2001)
- Mepilex® Ag, a silver impregnated soft silicone absorbent dressing, is a new dressing change. (Valencia et al 2001)
- The activity of silver lies in its ionic form and has the ability to bind at increased white blood cell count, odor, pain and exudate. (DeVington 2003)
- The case reviews suggest that Mepilex® Ag, the silver impregnated soft silicone absorbent dressing had a favourable influence on wound prognosis and was well tolerated and accepted in the treatment of venous leg ulcer with clinical signs of critical colonisation. The dressing performed well in terms of patient comfort and ease of use, while the incidence and severity of maceration and erythema decreased during the review period. (Mulder et al 2007)

Results
- At baseline the total wound surface area ranged from 2 cm² to 70 cm² which decreased to 1 cm² to 56 cm² at the end of 2nd week. Complete healing was achieved in one of the cases. At the end of 4th week, complete healing was achieved in another 2 cases and the remaining 2 cases demonstrated a total wound surface area reduction of 15.6% and 42.9 % respectively. Malodour, spontaneous pain, erythema, oedema and peri wound skin maceration disappeared at 2nd week in 80% of the cases. (Mulder et al 2007)
